New Product Announcement

Vacaville, California (March 21, 2016) – The Dust Patrol LLC, the makers of the D-SLR Brush, has introduced a full line of sensor cleaning swabs, sensor cleaning solution and optical wipes. All products are made in the USA.

Our New Alpha Premium Sensor Cleaning Swabs are very similar to the swabs primarily used by professionals for the past 20+ years, but with three main improvements. The predecessor to this swab was used by more photographers and repair stations than all others combined. With the predecessor's departure from the marketplace, we found a USA manufacturer and came up with our improved version at a favorable price point.

1. **Shorter Paddle** – a shorter paddle provides minimal flexing and better visibility.
2. **Thicker Handle** – a thicker handle provides minimal flexing, less pressure and a better grip.
3. **Color Coded** – color coding by size makes it easier for those cleaning multiple different cameras to quickly grab the right swab for the right camera.

Currently we offer three different sizes of swabs matching the different sensors sizes. We also offer each size swab in six different kit configurations. No competitive product comes close in terms of features, ease of use, guarantee and price.

Our New Gamma Optical Cleaning Fluid is the best sensor cleaning fluid on the market. Gamma Optical Cleaning Fluid is based on the chemical methanol which has been used since the conception of sensor cleaning. When used in an appropriate amount/volume, it will evaporate as quickly as it is applied, leaving clean optics and no residue. Not only is Gamma Optical Cleaning Fluid effective on sensors, it's well suited for all optics. Use with Delta Optical Cleaning Wipes for cleaning lens optics.

Delta Optical Cleaning Wipes are super soft, lint-free, strong and non-abrasive. These 4x4" (10x10cm) wipes are not your standard disposable lens tissue. These thick premium wipes are designed for cleaning optics and photographic emulsion. Use with Gamma Optical Cleaning Fluid for cleaning optics and Plexiglas. For cleaning film emulsion, use with acetone or other film cleaner.

Sample products are available upon request for bona fide media outlets and retailers.

Sincerely,

Curt Fargo
Manager
